Core Priorities

Last edited on **MAY 20, 2022**

Your **opportunity for impact** represents the range of what you might deliver in support of business needs, and the expectation of how you will deliver it as part of a team. This is determined by your: 

- **Core priorities** which are generally broader than specific actions or deliverables, and longer term than the span of time between Connects.
- **Key deliverables** (or critical indicator of success) which state what outcomes (or impact) you expect to deliver in support of a core priority. These may be specific actions, outcomes, measurements, etc.

All employees have a shared core priority for diversity & inclusion, and all managers have a shared core priority for managers, as shown below (Visit HRweb (<https://microsoft.sharepoint.com/sites/hrw/pages/performanceanddevelopmenthome.aspx#>) for additional guidance on Connects and core priorities) :

Our company-wide shared core priority for diversity & inclusion: (<https://microsoft.sharepoint.com/sites/hrw/Pages/Dlcorepriority.aspx>)

To realize our mission to empower every person and organization on the planet to achieve more, each and everyone of us must help create a diverse and inclusive culture where every one can bring their full and authentic self, where all voices are heard, and where we do our best work as a result. With this priority, personally commit to be an active and intentional participant in creating a diverse and inclusive Microsoft.

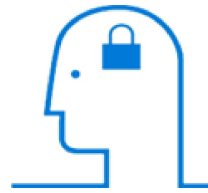

In the text box below, list your critical indicators of success for the company-wide core priority(s). Then, briefly state your additional (2-5) core priorities that represent your primary areas of focus, along with their associated critical indicators of success.

Understanding manufacturing keywords and its hidden aspects.

As part of the D&I core priority work on practicing more curiosity and demonstrating the courage to pick up new things.

In the spirit of a growth mindset, while we perform and deliver impact we also want to transform – by learning, finding lessons and inspiration in the success of others, self-reflecting and really hearing perspectives from others, embracing challenges and risks – this is how we continually improve.

Fixed Mindset leads to a desire to look smart and therefore a tendency to avoid challenges, give up easily, see failures as fruitless or worse, ignore useful negative feedback and feel threatened by the success of others.

Growth Mindset leads to a desire to learn and therefore a tendency to embrace challenges, persist in the face of setback, see failures as essential to mastery, learn from criticism and find lessons and inspiration in the success of others.

FROM: May 18, 2022 TO: Sep 30, 2022

Dates apply to Looking Back - Do not apply to Core Priorities

^ Looking Back

Consider your overall impact to the business through: Your key individual accomplishments, your results that built on the work, ideas or efforts of others, your contributions to the success of others and the resulting impact of each area. Apply a growth mindset and reflect on what you could have done differently for even greater results, consider what you learned.

What contributions did you make this period and what was the resulting business impact?

Employee comments:

Create Linked service flow: Created API for creating linked service connection in the synapse. This API will be used by customers primarily to create storage-linked service connections but with this API we can also create any linked connection just by changing the payload(which has a similar structure as in synapse), this can be used in the future in different scenarios to create other linked connection.

Made test connection for validation: To validate the payload sent by the user we make a test call to synapse to test the payload. Through this, we can give an accurate error to the user on why the create flow is failing. This also ensures that no dysfunctional linked service is formed which would fail the ingestion pipeline.

I also wrote the L1 test for this flow.

Register entity flow Created API for creating a custom table in the synapse by the customer. This API also enables users to define the relationship between tables. Wrote the logic to validate the payload. After the giving creation call to Synapse, this API also polls the job to ensure the creation of a registered entity in Synapse. I also contributed to uploading the out-of-box schemas in the cosmos. I also wrote the L1 test for the same.

This API helps the user to create custom entities. These tables will be used to store data.

AKS deployment: Worked with Suresh for Dogfood deployment. Wrote the Dockerfile for both ids service and worker service. Wrote the YML files to make the docker image in the PR and official pipeline. Tested the image in an aks cluster and modified the code for working in the cluster.

Create Dataverse linked connection: Explored how to connect to Dataverse from Synapse. Explore different ways to authenticate the user and settled on User-Managed Identity. Wrote logic to create Dataverse linked connection in Synapse.

POC Virtual Table and Data virtualization: Explored power app and dataverse platform. Used virtual tables to import IDS data from Dedicated SQL Pool and Azure SQL server into Dataverse. These virtual tables solve the problem of data duplication in Dataverse through data virtualization. Compared different methods like Custom Virtual Table Provider and Inbuilt Virtual Table Provider to perform CRUD operations on a SQL table in Azure by using virtual tables in Dataverse.

POC for incremental copy in synapse: created a pipeline in the synapse to incrementally copy data from two or more sources producing different data to a dedicated SQL. Optimized the pipeline to only copy the incremental data from the source instead of copying the whole data. Finally displayed the data from dedicated SQL to the dataverse platform.

Manager comments:

Devesh has delivered high quality work even during ambiguous situations and exhibited great collaboration skills. In last semester, he grew in terms of delivering solutions w.r.t complexity.

Below are highlights of his work/impact:

- Delivered linked service connections with high quality (and strongly typed) which helped in MDS core data ingestion pipeline configuration. Along with product code, he delivered good set of unit tests as well.
- He contributed in registering OOB entities, added appropriate unit tests.
- He developed register custom Entity API with appropriate validations in place.
- He delivered docker file for API/Worker service and collaborated with Suresh in creating deployment pipeline to deploy in AKS. Though it was first time for him w.r.t CI/CD, he was able to quickly grasp the context.
- He explored different ways to authenticate with data verse and delivered dataverse linked connections with good quality.
- In early days of Manufacturing incubation, he did a POC on exposing data as virtual tables in data verse platform, explored another available virtualization like customer table provider and inbuilt virtual table provider. He exhibited great exploration skills in virtual tables work stream.
- With Chaitanya's help, he worked on Synapse incremental copy support and made it work.

Overall, Devesh has great potential to become great Engineer in Microsoft. I wish him all the best.

What could you have done differently for even greater business impact?

Employee comments:

For Aks deployment, I first explored with windows container but the worker service was failing in it. After a lot of debugging, I could pinpoint the issue but we have to change the container to Linux as it was a worker service inner error. I should have explored the Linux container before as it would have saved some time.

Manager comments:

Good to see you self-reflecting and coming up with areas of improvement.

I would suggest if you felt that you are not able to make progress or struck with any issue, reach out to seniors for help. A fresh pair of eyes always helps.

^ Going Forward

Consider your overall potential impact to the business through: Your key individual accomplishments that will contribute to team, business or customer results, your results that will build on the work, ideas or effort of others and your contributions that will support the success of others.

What are your key deliverables and the expected business impact for the upcoming period?

Employee comments:

In the upcoming session, I would be improving the existing API and try to exceed the scope of the current product for zinc planning.

For creating a Linked connection, we are making a test call to synapse to validate the payload. In the case of the dogfood/ prod environment as we are using Vnet the interactive authoring is switched off by default which is required for making a test connection. So my next steps would be to enable interactive authoring for doing a test connection for create linked connection.

Manager comments:

As we embark on public preview journey, I would like you to help in delivering features in data store module (Entity CRU APIs, ADT representation of entities, Graph reconstruction and triggers, Graph snapshot & versioning etc.,).

- Be involved in the design and product discussions (asking relevant questions, sharing your thoughts etc.,) and help in generating more clarity for data store module.
- Use knowledge sharing sessions to share your learning from our explorations.
- Review the pull requests and provide feedback to help the teammates and it also gives you a good overview of the things that are happening in different streams.
- It would be great to see you involved in high-level designs and have an understanding of data store module in detail to demonstrate higher impact.

What will you do in the upcoming period to learn and grow? Consider the experiences or skills you would like to build for your growth and development. See Career Development Resources (<https://aka.ms/career>) to support you.

Employee comments:

I will try to get deeper understanding of of AKS working and Authentication related work.
I will try to try to find more edge cases for my APIs.

Manager comments:

I agree with your learning goals. In addition, start exploring about Azure Digital Twin features, DTDL models and explore about ADX capabilities which will help in your next set of features.
