Hiring Team

Rubrik

Dear Hiring Team,

I am writing to apply for a Software Engineer role at Rubrik. As a Software Engineer II at Microsoft with over four years building cloud-native, production-grade systems, I am drawn to Rubrik's mission of securing the world's data — a problem space that sits squarely at the intersection of distributed systems, cloud infrastructure, and security, all areas where I have shipped real product.

At Microsoft, I worked across the full stack of a cloud platform: from low-level ingestion pipelines to AI-powered copilots to React-based analytics UIs. On the Manufacturing Data Platform, I redesigned an IoT ingestion pipeline handling **330,000 nodes and 450,000 relationships**, cutting node ingestion time by **39%** and relationship ingestion by **54%**. I hardened the entire infrastructure by migrating all Azure services — Cosmos DB, Azure Data Explorer, Redis, Storage — to **virtual networks with private endpoints and managed identity**, eliminating all shared-key access patterns entirely. I also wrote the Bicep IaC templates that reduced customer provisioning time by six hours and brought deployment success to 98%. These are the kinds of reliability and security-first decisions I understand Rubrik values in every system it ships.

Security has been a consistent thread in my work. I am a **certified Threat Model reviewer** for Microsoft's Cloud for Industries team and have conducted security architecture reviews for production AI systems. I have also performed Responsible AI testing, deliberately finding vulnerabilities in our own copilot by probing jail-breaking and injection scenarios — the same adversarial thinking that matters when building data protection products.

On the AI side, I was the **first engineer across MCI** to ship the Azure OpenAI Assistant API into production. I designed the full pipeline — data-filtering layers, conversation threading, RAG-based retrieval, and file-search capability — taking end-to-end query accuracy from **40% to over 75%**. This work was showcased at HMI 2025 and directly powered customer engagements with Rolls Royce and Parsec. I understand that building AI features for enterprise customers requires not just model integration but rigorous accuracy measurement, customer-specific tuning, and production hardening.

More recently, I ramped onto a new team (Power Automate Process Mining) mid-cycle, built the entire OCPM overview page and five analytics widgets in **React, Fluent UI, and TypeScript**, and authored comprehensive Playwright end-to-end suites that significantly reduced manual QA effort. Onboarding quickly, owning features end-to-end, and leaving robust test infrastructure behind is something I take seriously.

I bring an IIT Bombay Dual Degree (B.Tech + M.Tech, Electrical Engineering + Minor CS, **CGPA 8.49/10**) and a track record consistently described by my manager as delivering "with high precision, quality and velocity" with "very minimal guidance." I thrive where the bar is high, systems are at scale, and the work directly protects customers.

Rubrik's approach to zero-trust data security and resilient recovery aligns with the infrastructure thinking I have been doing at Microsoft. I would love to bring that experience to a company whose core mission is data security.

Thank you for your consideration. I look forward to discussing how I can contribute to Rubrik's engineering team.

Sincerely,

Devesh Kumar
