Software Engineer II — Microsoft India | Power Automate

March 29, 2026

Hiring Team

LinkedIn

Dear Hiring Team,

I am applying for the Data Engineer role on LinkedIn's Data Science team. The work of turning large-scale member and product data into decision-enabling infrastructure maps directly onto the pipelines I have spent four years designing at Microsoft — where the central challenge is the same: make data flow fast, clean, and queryable at scale for people who depend on it.

At Microsoft, I owned the end-to-end IoT data ingestion pipeline for a cloud-native manufacturing knowledge graph serving enterprise customers including Rolls Royce and Parsec. By redesigning the architecture to eliminate a costly intermediary layer (Azure Digital Twin) and optimising the GROUP BY processing in Azure Data Explorer, I reduced **node ingestion time by 39% (18 → 11 min)** and **relationship ingestion by 54% (39 → 18 min)** for a graph of **330,000 nodes and 450,000 relationships**. Beyond throughput, I designed a separate real-time ETL stream — an Event Hub + Redis pipeline for entity and schema vectorization — fully decoupled from the main ingestion to prevent any interference with production data flow. I also led a cost-modelling analysis comparing ADLS vs. Azure Data Explorer for storing **~50 million rows**, directly informing the team's storage architecture decisions. On the query side, I built multi-hop graph query APIs on ADX using KQL, enabling analysts to run root-cause analysis across the full production graph with configurable depth and path filters.

I would welcome the opportunity to bring this pipeline and data-platform experience to LinkedIn's scale. Thank you for your consideration — I look forward to the possibility of a conversation.

Sincerely,

Devesh Kumar
