Software Engineer II — Microsoft India | Power Automate

March 29, 2026

Hiring Team

LinkedIn

Dear Hiring Team,

I am applying for the Software Engineer role at LinkedIn. The core challenge — architecting distributed systems that stay reliable and performant at internet scale — is one I have been solving for four years at Microsoft, where production reliability and throughput are non-negotiable for enterprise manufacturing customers running 24x7 operations.

At Microsoft, I owned architecture and delivery across the full stack of a cloud-native distributed platform built on Azure Kubernetes Service, Event Hub, Cosmos DB, Redis, and Azure Data Explorer. When our IoT ingestion pipeline became a bottleneck, I redesigned the architecture end-to-end — eliminating a costly intermediary layer and optimising batch processing — reducing **node ingestion time by 39% (18 → 11 min)** and **relationship ingestion by 54% (39 → 18 min)** for a graph of **330,000 nodes and 450,000 relationships**. To prevent a new real-time vectorization workload from degrading production throughput, I designed it as a fully decoupled async stream using a dedicated Event Hub channel — a deliberate synchronous-vs-asynchronous trade-off that protected system reliability. On the quality side, I introduced a **70% L0 test-coverage gate in CI**, eliminated **1,152 code warnings**, and standardised HTTP exception handling across the codebase — changes that measurably reduced production null errors. I also built Bicep IaC templates that cut customer infrastructure provisioning time by **6 hours** and pushed deployment success to **98%**.

I would welcome the opportunity to bring this distributed systems depth to LinkedIn's engineering team. Thank you for your time — I look forward to the possibility of a conversation.

Sincerely,

Devesh Kumar
